# **Fresh** cool drinking water

# Always

on tap and at a fraction of the cost of bottles

**You can enjoy a continuous supply of cooled fresh drinking water delivered directly to your premises via your own water supply.**

Ideal for installation in shops and offices, factories and warehouses, a water cooler from Yorkshire Water means that you'll never again run out of water. What's more it costs less than a penny a litre to supply. The same cost as water from a tap and far cheaper than most bottled water.

## **Refresh your business**

Keeping staff hydrated with a fresh supply of cool or ambient temperature drinking water helps them stay healthy and alert.

Each cooler is sanitised and maintained every six months and we continually treat and monitor water quality off site.

## **Hassle-free supply**

Unlike bottled water, our coolers require no organising of deliveries and no heavy lifting of stock for your staff. You don't need to store supplies creating more space for your business.

Optional extras to the water cooler include; a cup dispenser fitted to the side of the water cooler and a pumped drain incorporated into the water cooler to empty the drip tray and prevent overspill.

## **Environmentally friendly**

Install a water cooler and you'll be helping to reduce waste and carbon emissions too. That's because there's no plastic bottles to dispose of and no vehicles required to deliver them.

Our coolers are direct point of use, which means they are connected to your water supply and there is no internal tank. This means the water is chilled only when it's being dispensed, so the power consumption is minimal.

The cooler dispenses chilled (8°C) and ambient temperature water at a rate of up to 22 litres per hour.

## **Cheaper than bottled water**

Yorkshire water costs less than a penny a litre when a bottle can easily cost you many times that amount. In addition to this, we offer competitive weekly rental, installation and removal costs.

## **Fully compliant**

All our coolers are WRAS (Water Regulations Advisory Scheme) approved and installed by fully-qualified WIAPS (Water Industry Approved Scheme) plumbers. This means that the installation is fully compliant with the latest water regulations.

The cooler must be within five metres of a mains water supply, in accordance with water regulation best practice. In addition a local power supply must be within one metre of the cooler.

## **Response times**

Should the water cooler require attention, we will endeavour to respond by the end of the next working day.
